Configure RIP routing Protocol in routers

Aim:- Configuration of RIP routing Protocol.

Topology:-

The diagram illustrates a network topology with three routers and two PCs. Router 0 is connected to PC0 (10.0.0.1) and Router 1 (20.0.0.10). Router 1 is connected to Router 0 (20.0.0.10) and Router 2 (20.0.0.10). Router 2 is connected to PC1 (40.0.0.1).

Procedure:-

Step 1:- Create a network topology as shown above.

Step 2:- And configure PC0 and PC1 by setting IP address and gateway for both.

PC0 → IP 10.0.0.1  
Gateway 10.0.0.10.

PC1 → IP 40.0.0.1  
Gateway 40.0.0.10.

Step 3:- Configure the routers.

Router 0.

enable

config t.

Router(config)# int Fa0/0

Router(config-if)# ip address 10.0.0.10 255.0.0.0

Router(config-if)# no shut.

exit.

end 12/0

ip address 20.0.0.10 255.0.0.0

encapsulation PPP

clockrate 64000

no shut

exit.

NOTE :- The encapsulation 'ppp' should be given to all the routers and 'clockrate 64000' command should be only given to the clock symbolized sides of the router (i.e. open side).

→ For making the routers to know about the other devices, in the previous experiments we used static and the others with dynamic address but here we use routing protocol algorithm that itself makes the router to know other devices.

→ router rip

→ network 20.0.0.0 of router 2

network 30.0.0.0

router rip

network 30.0.0.0 } router 3  
network 40.0.0.0 }

router rip

network 10.0.0.0 } router 1  
network 20.0.0.0 }

Ping output:-

PC > Ping 40.0.0.1

pinging 40.0.0.1 with 32 bytes of data  
Reply from 40.0.0.1: bytes=32 time=0ms TTL=128  
Reply from 40.0.0.1 bytes=32 time=0ms TTL=128  
Reply from 40.0.0.1 bytes=32 time=0ms TTL=128  
Reply from 40.0.0.1 bytes=32 time=0ms TTL=128

ping statistics from 40.0.0.1

packets sent=4 Received=4 lost=0 (0% loss)

Approximate round trip times in ms

minimum=0ms maximum=0ms Average=0ms

Observation:-

RIP is the routing information protocol or a distance vector protocol that uses hop count as its primary metric. RIP defines how traffic routers should share information when moving traffic among an interconnected group of local area networks.

→ The RIP protocol here, used to connect the routers to one other and PC's using RIP protocol and message is pinged successfully

## TOPOLOGY:

## OUTPUT:

```
PC0
Physical Config Desktop Custom Interface
Command Prompt
Packet Tracer PC Command Line 1.0
PC>ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data:

Request timed out.
Reply from 40.0.0.1: bytes=32 time=8ms TTL=125
Reply from 40.0.0.1: bytes=32 time=5ms TTL=125
Reply from 40.0.0.1: bytes=32 time=10ms TTL=125

Ping statistics for 40.0.0.1:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 5ms, Maximum = 10ms, Average = 7ms
PC>
```
